

Penergetic b WV - Wildlife Deterrent Trial Deer Problem - Poland (2019)

This trial was undertaken by a new customer (the owner of a local fertilizer distribution outlet) who had never used Penergetic products before.

He applied penergetic b WV on a 10 ha (25 acre) field of rape (canola).

In past years, he has experienced serious crop damage in this field caused by deer. For example: two years ago, almost the whole field – all 10 ha (25 acres) – was destroyed.

This year, three weeks after applying penergetic b WV, no deer have been observed in the field. Consequently, he has expressed a high level of satisfaction with the observed results and therefore plans to continue to use the product going forward.

He has also recommended penergetic b WV usage to the Hunters Union¹. Impressed with the results they observed in the landowner's penergetic b WV-treated field, the Hunters Union has indicated they plan to conduct their own trials with the product next year.

¹ Reference to consulting with the “Hunters Union” may sound foreign to folks in North America. In Europe it is not uncommon for the local Hunters Union to be responsible for wildlife management (e.g. deer, feral pigs) and for protecting farm fields from damage caused by unwelcome, intruding wildlife. Whereas, In the U.S. and Canada, this role would, more typically, be the responsibility of an agency of the State (or Provincial) government.
